## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1, 2 and 6-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Applicant Admitted Prior Art; AAPA hereinafter; in view of Okubora et al. [6,445,475] and Shibata [US 5,434,747].

AAPA disclose an optical data link [figure 15A] comprising a mounting member [2] having a substrate [4] with a plurality of holes, and a plurality of electrically conductive pins [8] passing through said plurality of holes of said substrate; an optical element assembly [6], mounted on said mounting member;

AAPA disclose the claimed invention except for: a plurality of circuit boards comprising a circuit board having a pair of surface with an electrically conductive layer connected to at least one pin of said plurality of electrically conductive pins, each of said pair of surfaces mounting an electronic component; and means for supporting said circuit board so as to be spaced apart from said mounting member.

Okubora et al. disclose an optical module [figure 12] with a plurality of circuit boards comprising a circuit board [12] having a pair of surface with an electrically conductive layer connected to at least one pin of said plurality of electrically conductive

pins, each of said pair of surfaces mounting an electronic component; and means [40] for supporting said circuit board so as to be spaced apart from said mounting member .

It would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate Okubora et al.'s circuit with AAPA's module for the purpose of increasing capacities.

Shibata discloses an optical transceiver module [figure 5] comprising a first and second support members [5] having a substantially equal thickness for supporting of an optical element assembly.

It would have been obvious to one of ordinary skill in the art at the time of the invention was made to use the supporting members design of Shibata with AAPA and Okubora et al. for the purpose of preventing cross-talk between the electronics.

Regarding claim 2, Shibata further discloses wherein the cover being electrically conductive [column 3, line 3].

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the metal cover of Shibata with AAPA as modified for the purpose of providing EMI shielding.

***Allowable Subject Matter***

Claim 3 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is an examiner's statement of reasons for allowance: the prior art of record does not teach or suggest in the claimed combination a substrate (second circuit board) having holes to accommodate components mounted on the bottom of the first circuit board .
